Beyond Meteorites: Sample Return Missions

Analysis of meteorites is complicated by lack of context on their origin and potential contamination and weathering

Sample
return
missions
offer
new

Apollo (lunar samples, 1961-1972)

OSIRIS-REx
(asteroid sample, 2016-2025)

Stardust
(cometary sample, 1999-2006)

Different Sources of Asteroids

OSIRIS-REx

Origins

Return and analyze a sample of pristine carbonaceous asteroid regolith

Spectral Interpretation

Provide ground truth for telescopic data of the entire asteroid population

Resource Identification

Map the chemistry and mineralogy of a primitive carbonaceous asteroid

Security

Measure the Yarkovsky effect on a potentially hazardous asteroid

Regolith Explorer

Document the regolith at the sampling site at scales down to the sub-cm

REXIS (MIT) Student
Experiment maps the
elemental abundances

OCAMS (UA) PolyCam
>500K-km range, high-
resolution imaging of the
surface, **SamCam** images the
sample site and TAG, **MapCam**
provides landmark-tracking,
filter photometry.

OTES (ASU) maps the
thermal flux and spectra from
5 – 50 μm

OVIRS (GSFC) maps the
reflectance albedo and spectra
from 0.4 – 4.3 μm

TAGSAM (LM)
Collects the sample

SRC (LM) Returns
the sample

OLA (CSA) ranging to 7
km and maps the asteroid
shape and surface topography

NavCams (MSSS)
navigates the surface of Bennu

**Highly capable,
nimble spacecraft**

Bag

Secure

Helicopter transport

N2 Purge

Fly to Houston

Receive at JSC

How has the sample changed since collection?

Bulk 121 g sample shows no evidence of terrestrial contamination.

Except, the closed canister lid trapped some SRC debris which had an opportunity to mix with 1.24% of bulk sample on the avionics deck during transportation, even under the closest supervision.

121.6g of Sample

Requirement: Collect and return 60g from asteroid Bennu

~50g

~70g

~1g

What is the Bennu sample like?

- Smell is very strong (sulfur, gun-powder and burned marshmallows)
- Dark black with some lighter/white particles throughout and shimmery particles (different lighting changes appearance)
- Very fine powders that stick to everything and are very challenging to remove from surfaces
- Some pieces are very angular, and some are very hummocky
- Density varies

Rachel Funk, JSC

“RNA World” Hypothesis

Increasing molecular complexity

Laboratory analyses of prebiotic organics in pristine astromaterials will reveal more secrets about the pathway to life's chemistry

Evidence of Prebiotic Chemistry in the Bennu Samples

Pyrolysis

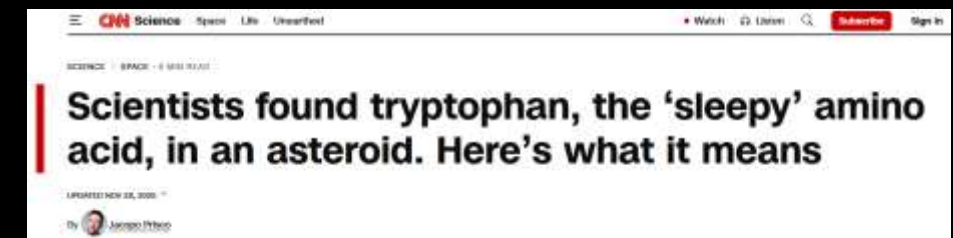

New wet chemistry pyrolysis GCMS developed by Angel Mojarro at Goddard used as a sample triage method.
← Derived from SAM instrument on Mars Curiosity Rover

Tryptophan is the most complex amino acid used in terrestrial biology. Its presence in Bennu samples tells us that carbon-rich asteroids could create more complex organic molecules than previously thought.

First confirmation of chemical building blocks of life in Bennu samples

- Bennu samples contain all canonical nucleobases (A, C, G, T, and U) found in life's genetic code.
- Bennu contains 15 of the 20 amino acids used to build proteins, including first detection of **tryptophan** in any extraterrestrial material.
- Missing 5 protein amino acids (Lys, Arg, Gln, Cys, His)

Ammonia & Formaldehyde Detected in Bennu Grains

Spectrum acquired by microprobe two-step laser desorption mass spectrometry (μ -L²MS) of several 100 μ m grains pressed into KBr window at JSC using vacuum UV photoionization at 118 nm

μ -L²MS data from S. Clemett (JSC)

Ammonia and formaldehyde are important chemical precursors for the formation of amino acids, N-heterocycles and other soluble organic molecules. Ammonia was heterogeneously distributed across the Bennu particles on the 5 μ m scale.

Abundant ^{15}N -rich Ammonia in Bennu Samples Suggests Icy Outer Solar System Origin

nature astronomy

Glavin & Dworkin et al. (2025) *Nature Astronomy* 9:199

Article

<https://doi.org/10.1038/s41550-024-02472-9>

Abundant ammonia and nitrogen-rich soluble organic matter in samples from asteroid (101955) Bennu

Potential sources of Bennu ammonia:

- 1) Ammonium salts
- 2) Ammoniated clays
- 3) N-rich insoluble organic matter
- 4) Hydrated Ammonium Mg-rich Phosphate (HAMP) grains
- 5) Mineral fluid inclusions (iron sulfide minerals)

Glavin & Dworkin et al. (2025) *Nature Astronomy* 9:199

Laize-G  n  rat et al. (2024) *Geochimica et Geophysica Acta* 387:1

Yoshimura et al. (2023) *Nature Communications* 14:5284

*Estimated from Pizzarello and Williams (2012) *Astrophysical Journal* 749:161

Chemical reaction scheme for the synthesis of glycine from formaldehyde:

Formaldehyde dimerization: $2 \text{H}_2\text{C=O} \rightarrow \text{HOCH}_2\text{CHO}$ (Glycolaldehyde)

Oxidation: $\text{HOCH}_2\text{CHO} \xrightarrow{\text{Oxidation}} \text{HCOCOOH}$ (Glyoxylic acid)

Condensation: $2 \text{HCOCOOH} \xrightarrow{-\text{H}_2\text{O}} \text{HOCH}_2\text{C(=O)C(=O)NHCH}_2\text{COOH}$ (N-Oxalylglycine)

Hydrolysis: $\text{N-Oxalylglycine} \xrightarrow{+\text{H}_2\text{O}} \text{H}_2\text{NCH}_2\text{COOH}$ (Glycine)

Experimental conditions for the synthesis:

- Reaction mixture: $\text{HOCH}_2\text{C(=O)H}$ (labeled ^{13}C), NH_3 , and H_2O
- Mol ratio: 1 : 10 : 1000
- Conditions: 60 °C, pH 11.6, 6 days

Chromatogram showing the separation of products:

- Peak 1 (Air): $\text{H}_2\text{NCH}_2\text{C(=O)C(=O)OH}$ (Glycine)
- Peak 2 (N_2): $\text{H}_2\text{NCH}_2\text{C(=O)C(=O)OH}$ (Glycine, labeled ~11 times)

Retention time (min): 27.0, 27.5, 28.0

The diagram illustrates the chemical pathways for the synthesis of nitrogen-containing heterocycles from aldehydes. The reactions are as follows:

- Aldol condensation:** $2 \text{ R-CH}_2\text{-CHO} \rightarrow \text{R-CH=CH-R} + \text{R-CH}_2\text{-CHO}$
- Imine formation:** $\text{R-CH}_2\text{-CHO} + \text{H}_2\text{N-R} \rightarrow \text{R-CH=N-R} + \text{H}_2\text{O}$
- Aromatization:** $\text{R-CH}_2\text{-CH=N-R} \rightarrow \text{R-CH}_2\text{-C}_5\text{H}_3\text{N-R}$ (Alkylpyridine)
- Reduction:**
 - $\text{R-CH}_2\text{-CH=N-R} \rightarrow \text{R-CH}_2\text{-CH}_2\text{-NH-R}$ (Alkylpiperidine)
 - $\text{R-CH}_2\text{-C}_5\text{H}_3\text{N-R} \rightarrow \text{R-CH}_2\text{-C}_4\text{H}_6\text{N-R}$ (Alkylpyrrolidine)
- Alkylpyrrole synthesis:** $\text{R-CH}_2\text{-CHO} \rightarrow \text{R-CH}_2\text{-CH(OH)-CHO} \xrightarrow{\text{H}_2\text{O}} \text{R-CH}_2\text{-CH(OH)-CH(OH)-R} \xrightarrow{-\text{H}_2\text{O}} \text{R-CH}_2\text{-C(=O)-C(=O)-R} \xrightarrow{2\text{NH}_3, -2\text{H}_2\text{O}} \text{R-CH}_2\text{-C(=N)-C(=N)-R} \rightarrow \text{R-CH}_2\text{-C}_4\text{H}_3\text{N}_2\text{-R}$ (Alkylimidazole)
- Alkylimidazoline synthesis:** $\text{R-CH}_2\text{-C}_4\text{H}_3\text{N}_2\text{-R} \xrightarrow{\text{H}_2\text{O}} \text{R-CH}_2\text{-C}_4\text{H}_4\text{N}_2\text{-R}$ (Alkylimidazoline)

The diagram also includes molecular models of water (H₂O) and ammonia (NH₃), and a photograph of the Murchison meteorite.

>23 N-heterocycles (including all 5 biological nucleobases) found in Bennu. Violation of Chargaff's rules (1:1 ratio of purines to pyrimidine bases in DNA) and biologically rare N-heterocycles indicate a non-terrestrial origin.

Single-ring pyrimidine bases more abundant than double-ring purines in Bennu (>2:1 ratio) suggesting preferential synthesis in ammonia-rich ices from the outer solar system.

All 5 nucleobases in DNA/RNA in Bennu and Ryugu!

Search for Extraterrestrial Amino Acids in Bennu

“Making Bennu Tea”

- **Glycine most abundant amino acid in Bennu samples**
33 amino acids were found (including 15 of the 20 protein AAs)
- **Racemic (D = L) alanine indicates no terrestrial biological L-protein amino acid contamination**
- **All chiral non-protein amino acids in Bennu were racemic**
β-ABA and **isovaline** → extraterrestrial origin.
- **Origin of L-valine excess in Bennu unclear.** Analyses underway to determine if the L-excess is from contamination or not.

Amino Acid Chirality “Handedness”

Bio-Essential Sugars Found in Bennu Samples

Bennu sample prepared at NASA, then extracted in 2% HCl and H₂O, derivatized and analyzed by GC-MS/MS at Tohoku University.

Furukawa et al. (2026) *Nature Geoscience* 19:19

Credit: NASA/Goddard/University of Arizona/Dan Gallagher

Detection of ribose (RNA sugar) but not 2-deoxyribose (DNA sugar), supports the RNA world hypothesis

Carboxylic Acids in Bennu Formed Through Interstellar and Parent Body Processes

13 carboxylic acids C₁-C₆ (mostly straight-chained) identified in four different Bennu sample hot water extracts consistent with synthesis during parent body aqueous alteration (Buckner *et al.* 2026)

Branched carboxylic acids in Bennu aggregate may indicate some **interstellar contributions**

Long-chain carboxylic acids (up to C₁₂) identified in 0.1M NaOH extracts of Bennu (Huang *et al.* *Nat. Comm.* in revision)

Prebiotic relevance: Carboxylic acids are lipid membrane subcomponents and key for metabolism

Bennu Polyphosphates Could Provide Energy for Early Prebiotic Chemistry

- Polyphosphates including diphosphate and triphosphate, principal components in ADP and ATP respectively, were identified up to heptaphosphate (P_7) in the water extracts of Bennu samples using ultrahigh-resolution mass spectrometry.
- The polyphosphates were associated with the occurrence of Na-bearing Mg phosphate, which was likely formed in the brine of the parent body of Bennu.
- All components (adenine, ribose, triphosphate) were available to make an ATP molecule as energy currency for protometabolism on the early Earth.

Naraoka *et al.* (2026)

ATP molecule for energy transfer in terrestrial biology

Phosphoesters in Bennu Provide Evidence of Abiotic Phosphorylation in Nature

- Phosphoesters are key structures for all life on Earth, however they have not been previously detected in extraterrestrial samples.
- Several organophosphorus compounds, including alkyl phosphates with C-O-P bonds essential for energy transfer and nucleic acid structure in biology.
- The results provides evidence of abiotic phosphorylation in Bennu's parent body, likely during evaporation of phosphate-rich fluids and organics.

Chemical Ingredients for Life Formed ~4.5 Gyr in a Wet and Salty World!

+ sugars, carboxylic acids/lipids, polyphosphates, alkyl phosphates, ...

Isotope Anomalies and ^{15}N -rich Organic Matter Point to an Outer Solar System Origin of Bennu

Large (~100 km diameter) icy outer solar system bodies may have been an important source of volatiles in the inner solar system required for the origin of life

Ocean Worlds

Implications for the Origin and Search for Life

- Volatile-rich asteroids like Bennu contain biologically important organic molecules that were spread throughout the early Solar System.
- Bennu's parent body could qualify as a habitable world (Ceres or Enceladus-like)
 - Mild temperatures ($T_{\text{max}} < 55^{\circ}\text{C}$)
 - Salty (evaporite minerals)
 - Alkaline fluids (pH ~ 8.2)
 - Wet (clays)
 - High soluble carbon, nitrogen, phosphorous, and sulfur
 - Organic molecules essential for life as we know it

Why didn't prebiotic chemistry advance further in Bennu's parent body to form larger organic polymers? What did the early Earth have that Bennu didn't?

dipeptides

nucleosides

nucleotides

ATP

Phospholipids
